Reasons for Allowance

The following is an examiner's statement of reasons for allowance: although the general idea of constructing an automotive passenger weight sensor by placing a fluid filled bladder somewhere in the seat cushion itself (and using at least one plate for even load distribution) and sensing the fluid pressure and an indication of weight, none of the references cited show a load sensor of the particular construction claimed mounted in the specific location claimed. The examiner notes that in general it is known to form a hydraulic pressure weight sensor by placing a fluid filled bladder between two plates and to preload the plates toward each other using a compliant element (I.E.: a spring) to put a preload on the sensor (and to use some type of fastener means to prevent excessive separation of the plates), but as noted above there seems to be no motivation in the art of record to mount this type of weight sensor between a frame of an automotive seat and the seat mounting bracket to form an automotive passenger weight sensor. All of the automotive passenger seat weight sensors of record which use hydraulic pressure to measure weight are mounted in the seat cushion itself, and therefore have a slightly different construction (which is apparently due to the fact that being mounted in the cushion allows for a less rigid construction of the weight sensor).

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
